

FLOW SAFE EQUIPMENT CC

STORZ COUPLINGS

Storz quick lock couplings are used mainly in the pneumatic conveying industry to connect hoses to each other or to rigid pipes.

The couplings are made from aluminium alloy. They have forged locking heads and die-cast hose shanks thus being light weight but with maximum mechanical strength. The locking heads are fitted with seals to ensure a positive leak-proof connection.

Both halves of the coupling are of identical symmetrical design and there are no male or female parts. Either half can be connected to any similar size of half coupling provided that the distance between the locking lugs is the same on both fittings.

During connection the locking heads of the hose couplings are rotated while the hose shanks remain firm in the hose preventing the necessity of having to twist the hose. The heads are so designed that when the internal locking lugs are fully engaged, accidental disconnection of the coupling is prevented.

Storz Hose Tail Coupling

Storz Female BSP Coupling

Storz Dust Cap (Blind Coupling)

Storz 3" Screwed Swivel Coupling
